System administrator / DevOps / Project Manager

Summary

A young System administrator and DevOps engineer. I have been working on both roles over the past 3 years and continue to do it. During the journey, I added freelancing in my career book. Working for someone may feel really good but working for yourself is always the best choice. My last adventure is related to IT project management. I have always been on the technical side of the things but I decided to make my move on the other side. Still, the end goal is far, far away. Right now you will find me in the middle between technology and management. Both of them on their own aren't as exciting as when they meet together. I constantly strive to understand and balance both, so that I can create useful and meaningful things for people.
